CLaim 1; Fig 1; 77pp; English.

CThe present sequence encodes dipeptidy! aminopeptidase (DPAP) from appropriate sequence encodes dipeptidy! aminopeptidase (DPAP) from the present sequence encodes dipeptidy! aminopeptidase (PP), appropriates, producing protein hydrolysate (PP), appropriates, producing protein hydrolysate (PP), appropriates, and animopeptidase (AP) to hydrolyse polypeptides, producing protein hydrolysate (PP), appropriates, and animopeptidase (AP) to hydrolyse seflavour enhancer, e.g. in baked goods, enriched in:

CC (a) Ala, Arg, Asp, Gly and/or Val, or (b), if the substrate has been deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. DPAP can also be used in flavour-class of or deactivating enzymes and for converting precursors to mature also for deactivating enzymes and for converting precursors to mature calso for deactivating enzymes and for hydrolysis of proteins and thus of flavour development, and a mixture with AP may hydrolyse tripeptides that are resistant to either enzyme used alone. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability, mouthfeel, aroma and crust
                                                                                                             Align seg 1/1 to: X00070 from: 1

CC A method has been developed for the production of protein hydrolysates CC (PH) comprising reacting a protein with: (1) at least one polypeptide CC with Gly-releasing activity; and (1) at least one other protease so that the amount of Gly produced is greater than when the protease is CC used alone. PH are used to improve flavour of foods (e.g. baked goods) CC and as animal feed additives. PH are preferably also enriched in Glu (free and/or peptide bound), so have improved flavour and palatability. CC addition of a polypeptide with Gly-releasing activity increases the CC degree of hydrolysis (or reduces the amount of enzyme needed) and CC hydrolysates have better solubility, and emulsifying and foaming CC properties. Baked goods containing them have improved aroma, mouthfeel and crust colour. The present sequence encodes Aspergillus oryzae CC aminopeptidase II, which is used in the method of the invention.

                                                                                                                                                                                                                    PT New aninopeptidase from Aspergillus oryzae - used to produce protein PT hydrolysates enriched in particular amino acids, used as flavour PT enhancers, e.g. in doughs
PT enhancers, e.g. in doughs
PS Claim 1; Fig 1; 32pp; English.

CC oryzae. Ap is used in combination with an endopeptidase (EP) to CC hydrolyse polypeptides, producing protein hydrolysate (PH), useful in CC flydrolyse polypeptides, producing protein hydrolysate (PH), useful in CC Gly (especially), Glu, Ser, Asp, Asn, Pro, Cys, Ala and/or Gln, or (b), CC if the substrate has been deamidated, in Glu (free and/or peptide bound), CC used in flavour-improving compositions (optionally containing EP) and in CC dough pre-maxes. Also AP can be used for deactivating enzymes and for converting precursors to mature proteins. AP increases the level of hydrolysis of proteins and thus of flavour development. PH have improved colubility, emulsifying and foaming properties, and products containing them have better flavour, palatability and aroma.

AP is used in combination with an endopeptidase (AP) to hydrolyse polypeptides, producing protein hydrolysate (PP), useful in foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Leu, (By (especially), Glu, Ser, Asp, Asn, Pro, Cys, Ala and/or Gln, or (b), if the substrate has been desmidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. AP can be used in flavour-improving compositions (optionally containing EP) and in dough pre-mixes. Also AP can be used for deactivating enzymes and for converting precursors to mature proteins. AP increases the level of hydrolysis of proteins and thus of flavour development. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability and aroma.

A method has been developed for the production of protein hydrolysates (PH) comprising reacting a protein with: (1) at least one polypeptide with Gly releasing activity; and (1) at least one other protease so that the amount of Gly produced is greater than when the protease is used alone. PH are used to improve flavour of foods (e.g. baked goods) and as animal feed additives. PH are preferably also enriched in Glu (free and/or peptide bound), so have improved flavour and palatability. Addition of a polypeptide with Gly-releasing activity increases the degree of hydrolysis (or reduces the amount of enzyme needed) and hydrolysates have better solubility, and emulsifying and foaming
                                                                                                                                                           the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bikunin can be used to treat or prevent brain and spinal cord oedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, if ibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing the cost of surgery. 85 A; 103 C; 115 G; 86 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                prostate-specific membrane antigen and DNA encoding it - is useful for detecting haematogenous micro-metastatic tumour cells and for identifying ligands which bind to PSM Ag Claim 3; Page 103-106; 196pp; English 065520 encodes a prostrate specific membrane antigen (PSM, R55097). The PSM coding sequence is useful for suppressing or modulating the metastatic ability of prostate tumour cells to grow, or for eliminating them. The protein is useful to identify or purify ligands of the Ag. It is also an attractive target for Ab-directed imaging and targeting of prostatic tumour deposits.

C A cDNA clone (T36785) codes for human 100 kDa prostate-specific membrane (PSM) antigen (M02234), an integral membrane glycoprotein that is very highly expressed in prostatic tumours and metastases. It was obtd. from lymph node carcinoma of prostate (LNCaP) cell mRNA by PCR amplification (see also T36795-808) and screening of an LNCaP cDNA clan be used to provide probes and primers useful e.g. in detecting hematogenous micrometastatic tumour cells and determining prostate cancer progression (see also T36827-30 and T36813-18), cand in gene therapy. An alternatively spliced PSM, PSM', has a shorter cDNA sequence. PSM genomic DNA is given in T36786.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Align seg 1/1 to: T36785 from: 1
anti-S. aureus vaccines
Claim 1; Page 1661-1662; 3271pp; English.
This sequence represents one of 5191 Staphylococcus aureus DNA sequences
This sequence represents one of 5191 Staphylococcus aureus DNA sequences
of the invention. The DNA sequences are recorded on a computer readable
medium, preferably selected from a floppy or hard disk, random access
memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
the S.aureus DNA sequences allows putative functions to be assigned so
that protein-encoding or regulatory regions of commercial, therapeutic or
industrial importance can be obtained. Specifically, sequences which are
likely to encode antigens have been identified and these polypeptides can
be used in a vaccine composition against S.aureus infection. The
polypeptides can also be used in a kit for the immunodetection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           documentation_block:

Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection associated protein expression claim 22; Fig 19D; 309pp; French.

Sequences X34001-X34255 represent nucleic acids encoding secreted sequences from yearious Mycobacterium species microorganisms. The
                                                                                                                                                                                                                                                    proteins from various Mycobacterium species microorganisms. The nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection. Sequence 1503 BP; 275 A; 470 C; 502 G; 256 T;

Saureus is implicated in numerous human diseases, including cellulitis, eyelld infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the Saureus DNA sequences contained on the computer readable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mycobacterium species nucleic acid sequence 19D.

Claim 22; Fig 19F; 309pp; French.

Csequences x34001-x34252 represent nucleic acids encoding secreted proteins from various Mycobacterium species microorganisms. The nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.

New G protein-coupled receptor kinase, GRK6, and corresp. DNA - are used in the prodn. of GRK6 and for the immunisation, treatment and diagnosis of diseases of the incure system and inflammation. Example 1; Page 9; 71pp; English.

The sequences given in Q87422-23 are primers which were used in the isolation of the novel human G protein-coupled receptor kinase (GRK6)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Guigueno A;

New 6 protein-coupled receptor kinase, GRK6, and corresp. DNA - are used in the production of GRK6 and for the immunisation, treatment and production of the immune system and inflammation. Example 1; Page 9; 71pp; English.

CC The sequences given in 087422-33 are primers which were used in the cisolation of the novel human G protein-coupled receptor kinase (GRK6). These primers are based on a partial rat GRK6 sequence isolated from the sequence DNA, These primers were used to amplify cDNA isolated coriginally thought to have the sequence given in 087425 but on further cisolation the sequence was found to have the sequence given in 087425 but on further considered from the sequence was found to have the sequence given in 087426.

CC This sequence was found to have one amino acid difference, corresponding to residue 61, compared to the GPK6 sequence given in 087426.

CC GRK6 may be used in immunisation, detection and quantification of GRK6. They may also be used for modulating the activities of GRK6, esp. those involved in signal transduction. Modulators of GRK6 may be useful in treatment of diseases and physiological conditions of the immune cc system, such as inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        seq_name: N_Geneseq_36:Q87423
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                These primers are based on a partial rat GRK6 sequence isolated from rat T cell cDNA. These primers were used to amplify cDNA isolated from Grown in human macrophage cDNA library. The isolated cDNA sequence was coriginally thought to have the sequence given in 087425 but on further isolation the sequence was found to have the sequence given in 087426. This sequence was found to have one amino acid difference, corresponding to residue 61, compared to the GPK6 sequence isolated from a human heart cDNA library by Benovic et al. J. Biol. Chem. (1993). Peptide fragments of GRK6 may be used in immunisation, detection and quantification of those involved in signal transduction. Modulators of GRK6 may be used to those involved in signal transduction. Modulators of GRK6 may be useful in treatment of diseases and physiological conditions of the immune system, such as inflammation.

Claim 1; Page 1716; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

Codouble-stranded DNA), which comprises one of the 7837 "GS" sequences

Cylven in T19001-726837 and which is able to hybridise to part of

Chuman genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature)

Sequences were obtained from 3'-directed CDNA libraries prepared

Crim various human tissues; synthesis of CDNA was initiated from the

3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-

cuntranslated sequence is unique to a particular mRNA species, almost

all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

is constructed so as to reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

The appearance frequency of a given GS in a cDNA library can be

determined (esp. using primers and probes derived from the GS

sequences) as a means of diagnosing abnormal cell function or for

recognising different cell types.
